Art Unit: 2629

## **DETAILED ACTION**

## **Double Patenting**

1. The nonstatutory double patenting rejection is based on a judicially created doctrine grounded in public policy (a policy reflected in the statute) so as to prevent the unjustified or improper timewise extension of the "right to exclude" granted by a patent and to prevent possible harassment by multiple assignees. A nonstatutory obviousness-type double patenting rejection is appropriate where the conflicting claims are not identical, but at least one examined application claim is not patentably distinct from the reference claim(s) because the examined application claim is either anticipated by, or would have been obvious over, the reference claim(s). See, e.g., *In re Berg*, 140 F.3d 1428, 46 USPQ2d 1226 (Fed. Cir. 1998); *In re Goodman*, 11 F.3d 1046, 29 USPQ2d 2010 (Fed. Cir. 1993); *In re Longi*, 759 F.2d 887, 225 USPQ 645 (Fed. Cir. 1985); *In re Van Ornum*, 686 F.2d 937, 214 USPQ 761 (CCPA 1982); *In re Vogel*, 422 F.2d 438, 164 USPQ 619 (CCPA 1970); and *In re Thorington*, 418 F.2d 528, 163 USPO 644 (CCPA 1969).

A timely filed terminal disclaimer in compliance with 37 CFR 1.321(c) or 1.321(d) may be used to overcome an actual or provisional rejection based on a nonstatutory double patenting ground provided the conflicting application or patent either is shown to be commonly owned with this application, or claims an invention made as a result of activities undertaken within the scope of a joint research agreement.

Effective January 1, 1994, a registered attorney or agent of record may sign a terminal disclaimer. A terminal disclaimer signed by the assignee must fully comply with 37 CFR 3.73(b).

2. Claims 20-44 are rejected on the ground of nonstatutory obviousness-type double patenting as being unpatentable over claims 1-57 of U.S. Patent No. 6,690,356. Although the conflicting claims are not identical, they are not patentably distinct from each other because claims 20-44 are broader version of patent claims.

The following is an example for comparing claim 20 of this application and claim 37 of Patent No. 6,690,356.

Claim 20 of this application	claim 37 of Patent No. 6,690,356
A computer implemented method for providing	A machine readable medium having stored
visual feedback to a computer user while	thereon executable program code which, when
manipulating texts displayed on a display	executed, causes a machine to perform a
device of a computer system, the method	method for providing visual feedback to a user
comprising:	during manipulation of selected text on a

Art Unit: 2629

	display device coupled with the machine, the machine including a control device for interactively positioning a visible symbol and an insertion caret on the display device, the machine also having a signal generation device for signaling an active state and an inactive state, the method comprising:
displaying a text object representing selected text when a visible symbol controlled by a control device is positioned near the selected text at a source location of a first window and when a button of the control device is in a second position;	a) in response to the active state of the signal generation device while the visible symbol is over the selected text at a source location on the display device:  1) creating and displaying a text object of the selected text, the text object including a visible portion of the selected text that is less than all the selected text;  2) de-emphasizing the selected text at the source location;
moving the text object following the visible symbol from the source location of the first window to a destination location of a second window while the button of the control device is the second position;	b) moving the text object on the display device along a line between the source location and the visible symbol until the text object reaches the visible symbol; d) moving the visible symbol in response to the control device and moving the text object in response to movement of the visible symbol; e) in response to an inactive state of the signal generation device while the visible symbol is over a destination location:  1) on the display zooming from a first bounding rectangle for the selected text at the source location to a second bounding rectangle for the selected text at the destination location such that the movement of the first bounding rectangle to the size and location of the second bounding rectangle at the destination location is animated; and
and displaying the selected text at the second location of the second window identified via an insertion caret when the button of the control device is in a first position.	c) displaying an insertion caret near the visible symbol to indicate a point of insertion of the selected text; 2) display on screen the selected text at the destination location

Art Unit: 2629

3. Claims 20-44 are rejected on the ground of nonstatutory obviousness-type double patenting as being unpatentable over claims 1-2 of U.S. Patent No. 6,396,474. Although the conflicting claims are not identical, they are not patentably distinct from each other since the application claims merely define an obvious variation of the patent claims.

The following is an example for comparing claim 20 of this application and claim 2 of Patent No. 6,396,474.

Claim 20 of this application	claim 2 of Patent No. 6,396,474
A computer implemented method for providing visual feedback to a computer user while manipulating texts displayed on a display device of a computer system, the method comprising:	A method for providing visual feedback to a computer user while manipulating selected text displayed on a display device of a computer system, the computer system including a control device for interactively positioning a visible symbol on the display device, the control device having a button having a first position and a second position, the method comprising:
displaying a text object representing selected text when a visible symbol controlled by a control device is positioned near the selected text at a source location of a first window and when a button of the control device is in a second position;	a) creating a text object from the selected text when the button is in the second position while the visible symbol is over the selected text at the source location;
moving the text object following the visible symbol from the source location of the first window to a destination location of a second window while the button of the control device is the second position;	b) zooming from a first bounding rectangle for the selected block of text at a source location to a second bounding rectangle for the selected block of text at the destination location such that the movement of the first bounding rectangle to the size and location of the second bounding rectangle at the destination location is animated.
and displaying the selected text at the second location of the second window identified via an insertion caret when the button of the control device is in a first position.	

Art Unit: 2629

As can be seen above, claim 2 of U.S. Patent No. 6,396,474 differs from claim 20 of this application in not displaying the selected text at the second location via an insertion caret. However, the patent claims are in comprising format and therefore covers structure not specifically recited. The patent disclosure clearly describes displaying the selected text at the destination location via an insertion caret and are encompassed by the patent claims comprising format.

4. Claims 20-44 are rejected on the ground of nonstatutory obviousness-type double patenting as being unpatentable over claims 1-5 of U.S. Patent No. 5,694,151. Although the conflicting claims are not identical, they are not patentably distinct from each other since the application claims merely define an obvious variation of the patent claims.

The following is an example for comparing claim 20 of this application and claim 3 of Patent No. 5,694,151.

01: 00 - 01:	plaim 2 of Dotant No. 5 064 151
Claim 20 of this application	claim 3 of Patent No. 5,964,151
A computer implemented method for providing	A method for providing visual feedback to a
visual feedback to a computer user while	computer user while manipulating selected text
manipulating texts displayed on a display	displayed on a display device of a computer
device of a computer system, the method	system, the computer system including a
comprising:	control device for interactively positioning a
. 0	visible symbol on the display device, the
	control device having a button having a first
	position and a second position, the method
	comprising:
displaying a text object representing selected	a) in response to the button being in the second
text when a visible symbol controlled by a	position while the visible symbol is over a
control device is positioned near the selected	selected text at a source location;
text at a source location of a first window and	1) creating a text object from the selected text;
when a button of the control device is in a	2) display on the display the text object over
second position;	the selected text at the source location;
	b) initializing an interpolation factor, said
	interpolation factor comprising a value utilized
	to generate incremental steps between a

Art Unit: 2629

	starting point and an ending point; c) computing a distance between the text object and a first point on the display device associated with the location of the visible symbol;
moving the text object following the visible symbol from the source location of the first window to a destination location of a second window while the button of the control device is the second position;	d) moving the text object along an imaginary line between the source location and the first point to a point on the display device determined by the distance adjusted by the interpolation factor; e) with the button in the second position, incrementing the interpolation factor if it has not reached a maximum value, the repeating steps c) through 3); f) if the button is in the first position over a destination location: 1) computing a first bounding rectangle for the selected text at the source location; 2) computing a second bounding rectangle for the selected text at the destination location; 3) zooming from a first bounding rectangle at a source location to a second bounding rectangle at the destination location such that the movement of the first bounding rectangle to the size and location of the second bounding rectangle at the destination location is animated.
and displaying the selected text at the second location of the second window identified via an insertion caret when the button of the control device is in a first position.	displaying on the display device the selected text at the destination location after zooming from the first bounding rectangle at the source location to the second bounding rectangle at the destination location.

As can be seen above, claim 3 of U.S. Patent No. 5,694,151 differs from claim 20 of this application in not displaying the selected text at the second location via an insertion caret. However, the patent claims are in comprising format and therefore covers structure not specifically recited. The patent disclosure clearly describes displaying the selected text at the

Art Unit: 2629

destination location via an insertion caret and are encompassed by the patent claims comprising format.

5. Claims 20-44 are rejected on the ground of nonstatutory obviousness-type double patenting as being unpatentable over claims 1-21 of U.S. Patent No. 5,561,444. Although the conflicting claims are not identical, they are not patentably distinct from each other since the application claims are broader version of patent claims.

The following is an example for comparing claim 20 of this application and claim 1 of Patent No. 5,561,444.

Claim 20 of this application	claim 1 of Patent No. 5,561,444
A computer implemented method for providing visual feedback to a computer user while manipulating texts displayed on a display device of a computer system, the method comprising:	A method for providing visual feedback to a computer user while manipulating selected text displayed on a display device of a computer system, the computer system including a control device for interactively positioning a visible symbol and an insertion caret on the display device, the computer also having a signal generation device for signaling an active state and an inactive state, the method comprising the computer implemented steps of:
displaying a text object representing selected text when a visible symbol controlled by a control device is positioned near the selected text at a source location of a first window and when a button of the control device is in a second position;	<ul> <li>a) in response to the active state of the signal generation device while the visible symbol is over the selected text at a source location on the display device:</li> <li>1) creating and displaying a text object of the selected text, the text object including a visible portion of the selected text that is less than all the selected text;</li> <li>2) de-emphasizing the selected text at the source location;</li> </ul>
moving the text object following the visible symbol from the source location of the first window to a destination location of a second window while the button of the control device	b) in a finite series of steps, moving the text object on the display device along a line between the source location and the visible symbol until the text object reaches the visible

Art Unit: 2629

is the second position;	symbol; d) moving the visible symbol in response to the control device and moving the text object in response to movement of the visible symbol; e) in response to an inactive state of the signal generation device while the visible symbol is over a destination location: 1) on the display zooming from a first bounding rectangle for the selected text at the source location to a second bounding rectangle for the selected text at the destination location such that the movement of the first bounding rectangle to the size and location of the second bounding rectangle at the destination location is animated; and
and displaying the selected text at the second location of the second window identified via an insertion caret when the button of the control device is in a first position.	c) displaying an insertion caret near the visible symbol to indicate a point of insertion of the selected text; 2) displaying on screen the selected text at the destination location.

As can be seen above, claim 20 of this application is broader version of claim 1 of Patent No. 5,561,444.

6. In view of the above analysis, applicant's claims and patent claims are not patentably distinct from one another and in the absence of a terminal disclaimer would result in an unjustifiable time wise extension of applicant patent.

## Claim Rejections - 35 USC § 102

7. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

Art Unit: 2629

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

- (e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.
- 8. Claims 20-44 are rejected under 35 U.S.C. 102(e) as being anticipated by Greyson et al (US 5,442,742 hereinafter Greyson).

The applied reference has a common assignee with the instant application. Based upon the earlier effective U.S. filing date of the reference, it constitutes prior art under 35 U.S.C. 102(e). This rejection under 35 U.S.C. 102(e) might be overcome either by a showing under 37 CFR 1.132 that any invention disclosed but not claimed in the reference was derived from the inventor of this application and is thus not the invention "by another," or by an appropriate showing under 37 CFR 1.131.

As to claims 20, 28, 36, 44, Greyson discloses a computer implemented method for providing visual feedback to a computer user while manipulating texts displayed on a display device of a computer system, the method comprising: displaying a text object representing selected text when a visible symbol (cursor) controlled by a control device (mouse) is positioned near the selected text at a source location of a first window and when a button of the control device is in a second position (see Fig. 2b); moving the text object following the visible symbol from the source location of the first window to a destination location of a second window while the button of the control device is the second position; and displaying the selected text at the second location of the second window identified via an insertion caret (214) when the button of the control device is in a first position (see Figs. 2c-2i).

Art Unit: 2629

As to claims 21, 29, 37, Greyson teaches during moving the text object from the source location to the destination location, the selected text is deemphasized while the text object is emphasized (the selected text is highlighted, and it is inherent that the selected text at the source location is deemphasized when the operation is "copy").

As to claims 22, 30, 38, Greyson teaches displaying a first bounding rectangle (an outline 211 in Fig. 2b) for the selected text of the source location in response to displaying the text object; and displaying a second bounding rectangle (outline 211 in Figs. 2c, 2d for example) for the selected text of the destination location identified by the insertion caret (214).

As to claims 23, 31, 39, Figs. 2b-2i of Greyson teaches visually zooming at least a portion of the selected text from the first bounding rectangle of the source location to the second bounding rectangle of the destination location when the button of the control device is in the first position (the outline of the selected text 211 is moved from the first location to the second location).

As to claims 24, 34, 40, Fig. 2c of Greyson teaches removing the selected text at the source location (blank area 215) after the visually zooming is completed and the selected text is displayed at the destination location.

As to claims 25, 33, 41, Fig. 2c of Greyson teaches visually snapping the text object (handle 212) to the visible symbol when the visible symbol is positioned near the selected text of the source location and when the button of the control device is in the second position.

As to claims 26, 34, 42, Fig. 2b-2i of Greyson teaches the visible symbol (cursor) is displayed in a first shape (214) when the visible symbol is positioned within a proximity of the

Art Unit: 2629

selected text of the source location, indicating that the text object can be created and snapped to the visible symbol (during the "dragging").

As to claims 27, 35, 43, Greyson teaches the visible symbol is displayed in a second shape when the visible symbol is positioned outside of a proximity of the selected text of the source location (it is inherent the cursor is in a different shape when no "dragging").

9. Claims 20-44 are rejected under 35 U.S.C. 102(b) as being anticipated by Alpert et al ("A Technique for Improving the Interactivity of Direct Manipulation", IBM Technical Disclosure Bulletin; hereinafter Alpert).

As to claims 20, 28, 36, 44, Alpert discloses a computer implemented method for providing visual feedback to a computer user while manipulating texts displayed on a display device of a computer system, the method comprising: displaying a text object representing selected text when a visible symbol controlled by a control device is positioned near the selected text at a source location of a first window and when a button of the control device is in a second position (Fig. 1, page 21, first paragraph); moving the text object following the visible symbol from the source location of the first window to a destination location of a second window while the button of the control device is the second position (page 21, first paragraph); and displaying the selected text at the second location of the second window identified via an insertion caret when the button of the control device is in a first position (Figs. 4-6).

As to claims 21, 29, 37, Alpert teaches during moving the text object from the source location to the destination location, the selected text is deemphasized while the text object is emphasized (see Figs. 1, 2).

Art Unit: 2629

As to claims 22, 30, 38, Alpert teaches displaying a first bounding rectangle (an outline of the selected text, Fig. 1) for the selected text of the source location in response to displaying the text object; and displaying a second bounding rectangle (see Figs. 4, 5) for the selected text of the destination location identified by the insertion caret (the vertical bard before "that works", Fig. 4).

As to claims 23, 31, 39, Figs. 1-6 of Alpert teaches visually zooming at least a portion of the selected text from the first bounding rectangle of the source location to the second bounding rectangle of the destination location when the button of the control device is in the first position (the outline of the selected text is moved from the first location to the second location).

As to claims 24, 34, 40, Alpert teaches removing the selected text at the source location after the visually zooming is completed and the selected text is displayed at the destination location (it is inherent that the selected text is removing at the source location when the operation is "cut").

As to claims 25, 33, 41, Alpert teaches visually snapping the text object to the visible symbol when the visible symbol is positioned near the selected text of the source location and when the button of the control device is in the second position (page 22, 4<sup>th</sup> paragraph, which states "during text dragging the user see a special cursor").

As to claims 26, 34, 42, Alpert teaches the visible symbol is displayed in a first shape when the visible symbol is positioned within a proximity of the selected text of the source location, indicating that the text object can be created and snapped to the visible symbol (page 22, 4<sup>th</sup> paragraph, which states "during text dragging the user see a **special** cursor").

Page 13

Application/Control Number: 10/697,845

Art Unit: 2629

As to claims 27, 35, 43, Alpert teaches the visible symbol is displayed in a second shape when the visible symbol is positioned outside of a proximity of the selected text of the source location (the cursor is not in special shape when no text is dragging).

10. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Regina Liang whose telephone number is (571) 272-7693. The examiner can normally be reached on Monday-Friday from 8AM to 5:00PM.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Richard Hjerpe, can be reached on (571) 272-7691. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
